                                                                                                                                                                                                                                                                                                            This is the nuclectide sequence of open reading frame ORF6 of grapevine leafroll virus type 2 (GLRaV-2) RNA (see AAV08874). It codes for a 22 bda coat protein (see AAV08864). It genome includes 9 open reading frames (see AAV08864-72) for a polyprotein, an RNA-dependent RNA polymerase, heat shock proteins, cat proteins of unknown function (see AAW3346-84). The polyprotein of produce antibodies useful for detecting These can be used to produce antibodies useful for detecting miscules can be used to produce antibodies useful for detecting molecules can be used to produce probes and primers for such molecules can be used to produce probes and primers for such colls, and to transform host cells (especially Agrobacterium tumefaciens, grape, citrus, beet or tobacco cells) and produce transgenic plants (claimed). They can be used to impart GRRaV-2 resistance to Vitis scion or roctstock cultivars or Nicotiana cultivars (claimed). Because extensive similarity exists between hisp?O-related sequence regions of GLRaV-2 and other clostercviruses, the DNA may also be used to impart beet yellows virus resistance to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  type 2 (GLRAV-2) has been sequenced and cloned from GLRAV-2 isolated from infected Vitis vinifers ov. Pinot Noir. About 83% costaed from infected Vitis vinifers ov. Pinot Noir. About 83% coftend from infected Vitis vinifers ov. Pinot Noir. About 83% coftinged from infected Vitis vinifers ov. Pinot Noir. About 83% coffirmed from several overlapping clones. The sequence in the cost protein gene region was determined and confirmed from several overlapping clones. The sequence of GLTAV-2 includes 9 open reading frames (see also AAV08864-72) encoding a polyprotein (see AAW71476) having papain-like proteins of GLTAV-2 includes 9 open reading frames (see also proteins of unknown function (see AAW71476, ABV1476) having papain-like proteins of unknown function (see AAW71476-84). These proteins can be used to produce antibodies, useful to detect GLRAV in samples e.g. by ELISA (claimed). The nucleic acid molecules can be used to produce probes and primers for such detection, and to transform host cells (especially Agrobacterium vitis, Agrobacterium tumefactens, grape, cittus, beet or tobacco cells) and produce transgenic plants (claimed). In particular, they can be used to impart GLRAV-2 resistance to vitis scion or rootstock cultivars or Nicotiana (claimed). Because extensive similarity exists between history variate between the DNA may also be used to impart beet yellows virus resistance to cittus scion color transform.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAT42975-77 represent cDNA sequences encoding coat proteins from beet yellow virus (BYV) beet western yellow virus (BNYV) and beet necrotic yellow vein virus (BNYVV) respectively. These sequences are used in the recombinant DNA sequence of the invention. This comprises nucleotide sequences encoding the coat proteins of at least one luteovirus and at least one closterovirus. This recombinant DNA may be used to transform sugar beet for combatting viral infection. Other plants may also be transformed e.g. fruit such as mangoes, apples, pears, bananas, and field crops such as sunflower, wheat, barley, maize, and vegetables such as potatoes, carrots, cabbage and onion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant DNA sequence comprising at least two coat protein genes - used to combat viruses in e.g. sugar beet

                                                                                                                                                                                                                                   This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Bax resistant yeast or fungi, identifying, or obtaining and identifying Candida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death or identifying inhibitors or inhibitor sequences of Bax-induced cell death. The products of the invention have cytostatic, fungicide; immunosuppressive, virucide and vasocropic activity and can be used in vaccines or for gene therapy. The isolated nucleic acids, polypeptides, pharmaceutical compositions,

preparing a medicament for treating, preventing and/or alleviating diseases associated with yeast or fungi or proliferative disorders, such as cancer, or for preventing apoptosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunising against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease, ischaemia, diseases related with viral infections or neurodegenerations. This sequence represents a polymorecotide associated with the Bax gene described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    137

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the genomic sequence of Pyrococcus abyss; and P. abyss; proteins (see AAB96637.AAB96842). P. abyssi is a hypothic archaeon, which is isolated from deep-sea hydrotheral vents. The present sequence is a fragment of the genomic sequence of P. abyss. The 3 rend of this sequence overlaps with the 5' end of AAH41223. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LysteuLeuSerAlaGluValGluLysMetLeuValGlnLysGlyAlaProAsnGluGly 45
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    48

The total plasmid DNA of Wl was co-electroporated with shuttle vector pSA3 into phage-sensitive, plasmid-free L. lactis LM0230. Phage-resistant transformants were isolated and found to contain pSRQ800. The isolated DNA can be used to impart phage resistance to bacteria, esp. L.l., for use in the prodn. of fermented dairy

                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a grapevine leafroll virus (GLRaV-5) DNA sequence of the invention. The DNA sequence can be used in an expression construct. The construct is useful for providing resistance to GLRaV infection in a recombinant plant cell by transforming the plant cell with it, where transcription of the polynucleotide sequence interferes with a normal viral function such as movement, encapsidation or replication of viral RNA. The polynucleotide sequence is expressed as an antisense sequence and encodes a GLRaV coat protein, preferably a defective GLRaV coat protein or a GLRaV HSF70 homologue protein. The GLRaV-5 DNA is useful for the synthesis of GLRaV, as diagnostics and probes, for viral gene mapping and for induced plant disease resistance. It is also useful to detect and quantitate expression of GLRaV in plant tissue prior to use in vegetative propagation, by detecting the presence of GLRAV RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           144

The present invention describes a gene (I) derived from Buchnera sp. containing the DNA (a) or (b), (a) has a fully defined base pair sequence selected from a table of sequences found in the Buchnera sp. genemic DNA of ABA92787 given in the specification or is a DNA selected from complementary DNA sequences, and (b) is a DNA which hybridises with the DNA (a) and encodes a protein. Also described are: (I) a recombinant vector (II) containing (I); (2) a transformant (III) containing (II); (3) a genomic DNA of Buchnera sp. containing the sequence given in ABA92787; (4) a plasmid derived from Buchnera sp. containing DNA (c) or (d), (c) is a DNA containing a fully defined sequence given in ABA92786 or ABB92789 and (d) is a plasmid which hybridises with a DNA; and (5) a method for the preparation of a protein in which (III) is cultured and the expression protein of the objective protein is collected from the cresultant culture. The DNA is useful for developing agricultural chemicals for exterminating cockroaches. The present sequence represents the specifically claimed Buchnera sp. genomic DNA sequence from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          435915 AAAAATCAACGTGGATCATTAAGCATTGATGACGAAGGTACTCCAGGTCAAAGAATATT 435856

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -----AACCGGCTCGAAAATATGATGGAAAAA 678
This sequence represents DNA encoding a 46.5 kD immunogenic fragment of the protective polypeptide antiqen (PPA) of the bacterium Erysipelothrix rhusiopathiae. This bacterium infects livestock, particularly pigs (swine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for stimulating an immune response in animals against Erysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous

                                                                                                                                                                                                                                                                                                                                        The invention relates to a 46.5 kD immunogenic fragment (AAB148CO) of the protective polypeptide antigen (PPA) of the bacterium Erysipelothrix Thusiopathiae, and to DNA encoding it (AAA72113). This bacterium infects livestock, particularly pigs (swine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for stimulating an immune response in animals against Erysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous administration. The present sequence represents the coding sequence of DNA encoding the full-length PPA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          80 GlyGluArgAsrValValThrGluGlyAspLeuLysLysValLeuAspGlyCysAla 99

The present sequence is that of the Epa gene of strain Fujisawa of Erysipelctirix rhusiopathiae, the causative agent of erysipelas in antiger (see Arysipeloid in humans.) The gene encodes a protective antiger (see Arysipaloid in humans.) The gene encodes a protective antiger (spa A.I.) It was isolated from a genomic DNA library of strain Fujisawa by immunoscreening using E. rhusiopathiae convalescent polyseptide comprising residues 12-195 of the protein, especially a sidentified as a vaccine antiger. The N-terminal polypedide was shown to protect mice and pigs from a lethal challenge with E. rhusiopathiae. Vaccines containing immunogenic polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccines for protecting turkeys and pigs against Erysipelothrix rhusiopathiae infections comprising a polypeptide sequence from the N-terminal region of an erysipelas protective antigen -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   952
                                                                                                                                                                                                            The invention relates to a 46.5 kD immunogenic fragment (AAB14860) of the protective polypeptide antigen (PPA) of the bacterium Erysipelothrix rhusiopethiae, and to DNA encoding it (AAA72313). This bacterium infects livestock, particularly pigs (swine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for stimulating an immune response in animals against Erysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous administration. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             844 AGATTAACGATTCCTGAACTTGATGAAGCATACGTTGATTACTCGTGAATTACGAGGTG

Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AEROGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2298
